□ p-norm:

$$\|x\|_p = (|x_1|^p + |x_2|^p + \dots + |x_n|^p)^{\frac{1}{p}}$$

subject to $p \geq 1$

□ What is the shape of $\|x\|_p = 1$?

□ Properties?

□ 1-norm(l_1):

$$\|x\|_1 = (|x_1| + |x_2| + \dots + |x_n|)$$

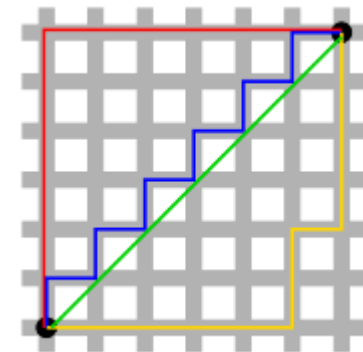

□ What is the shape of $\|x\|_1 = 1$?

□ The distance between two vectors under the l_1 norm is also referred to as the **Manhattan Distance**.

□ Properties?

Example

l_1 distance between $(0, 1)$ and $(1, 0)$?

□ ∞ -norm(l_∞)(max norm):

$$l_\infty = \max(|x_1|, |x_2|, \dots, |x_n|)$$

□ What is the shape of $|x|_\infty = 1$?

□ Properties?

□ $\frac{1}{2}$ -norm($l_{\frac{1}{2}}$)

□ What is the shape of $|x|_{\frac{1}{2}} = 1$?

□ Properties?

□ 0-norm(l_0):

$$\|x\|_0 = \lim_{\alpha \rightarrow 0^+} \|x\|_\alpha = \left(\sum_{k=1}^n |x|^\alpha \right)^{\frac{1}{\alpha}} = \sum_{k=1}^n 1_{(0,\infty)}(|x|)$$

□ 0-norm, defined as **the number of non-zero elements in a vector**, is an ideal quantity for feature selection. However, minimization of 0-norm is generally regarded as a combinatorially difficult optimization

$$\square \|x\|_0 = \sum_{x_i \neq 0} 1$$

❑ Is 0-norm a norm?

❑ What is the shape of $\|x\|_0 = 1$?

Examples

- l_0 distance between $(0, 0)$ and $(0, 5)$?
- l_0 distance between $(1, 1)$ and $(2, 2)$?
- (username, password)

Class Activity

- l_0 distance between $(0, 0)$ and $(0, 5)$?
- l_0 distance between $(1, 1)$ and $(2, 2)$?
- (username, password)

Or go to the below link

<https://forms.gle/xFHSDKJDq1KoL4Kx6>

Timer: (2:30 minutes)

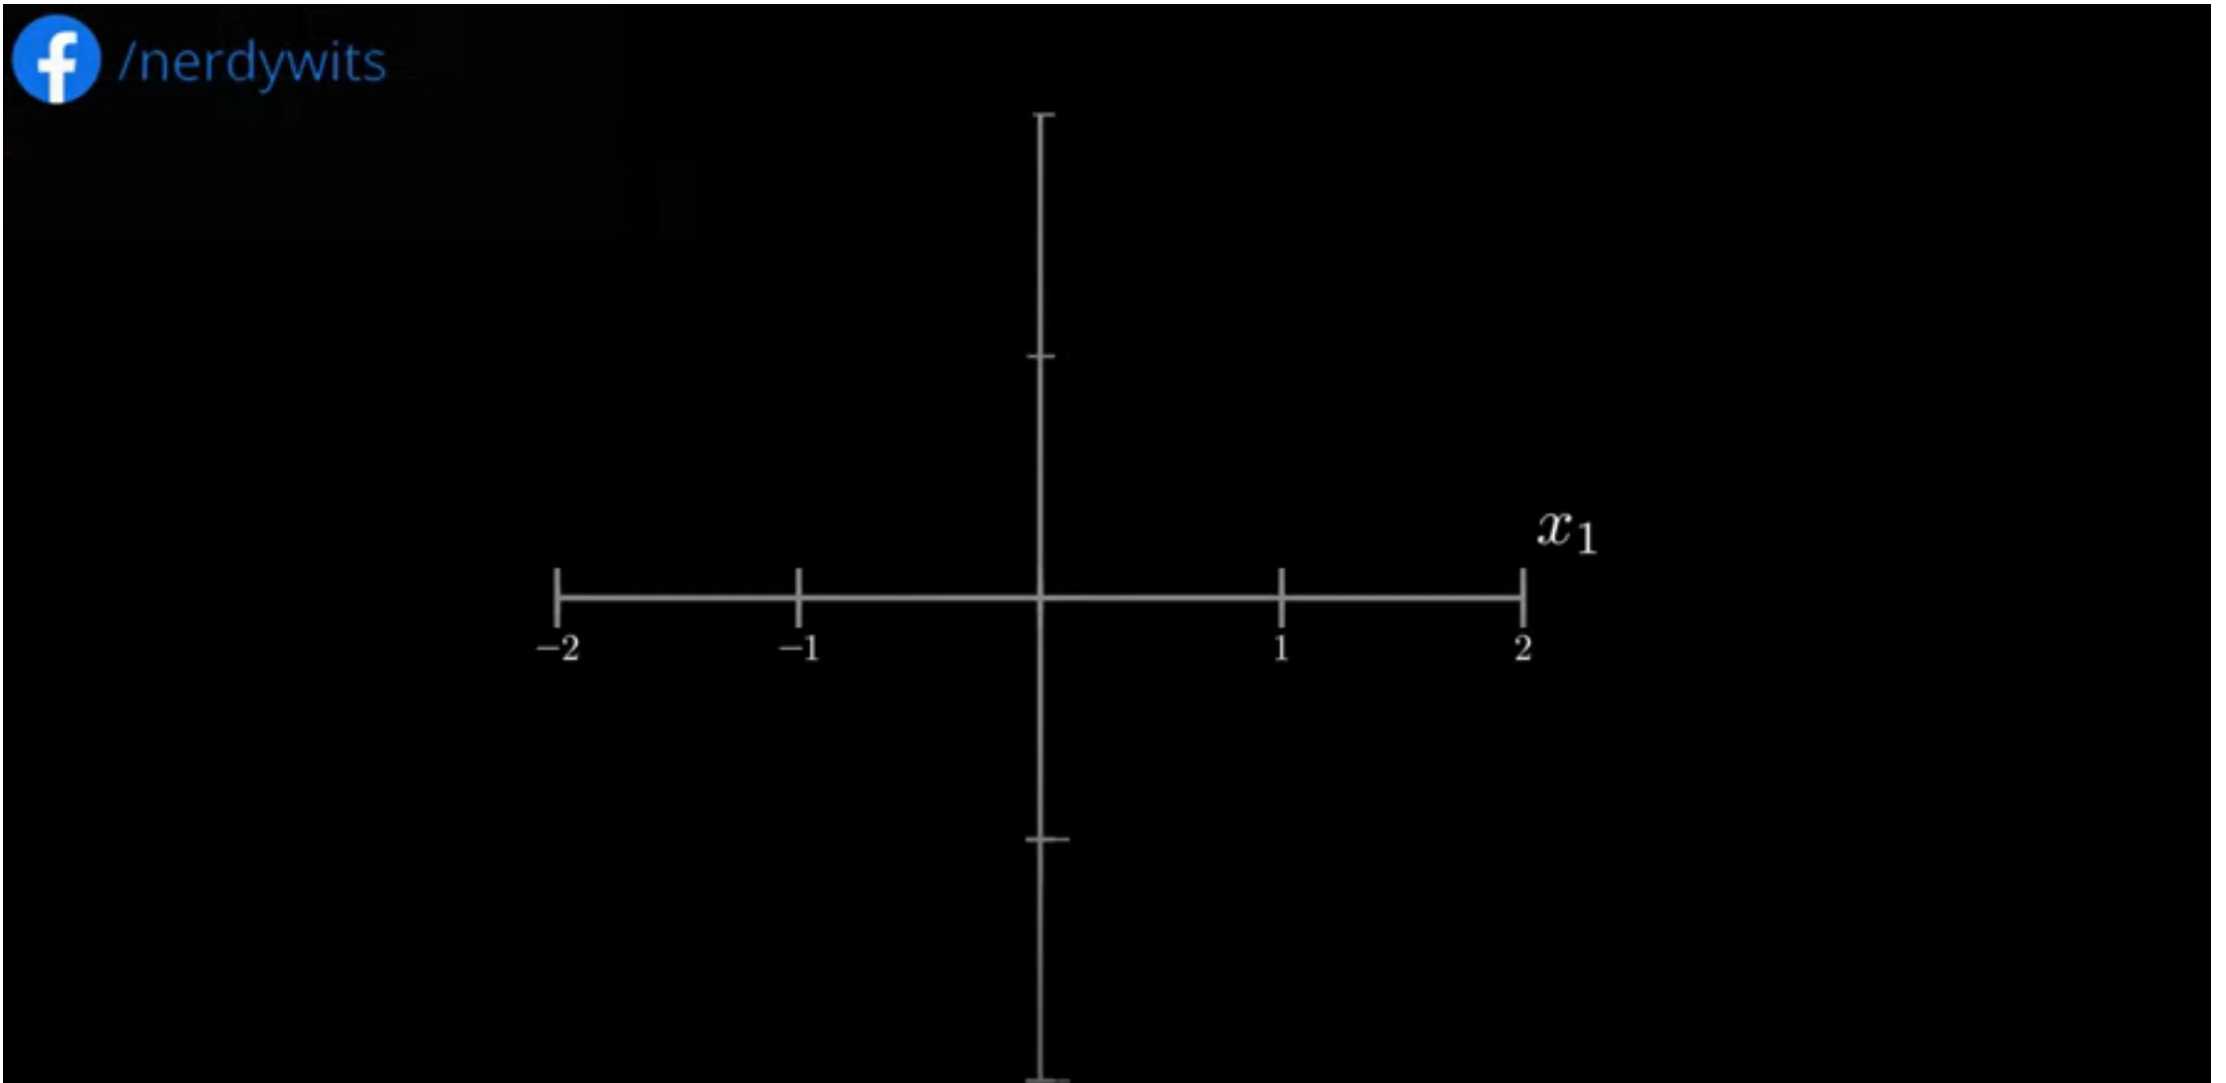

Examples

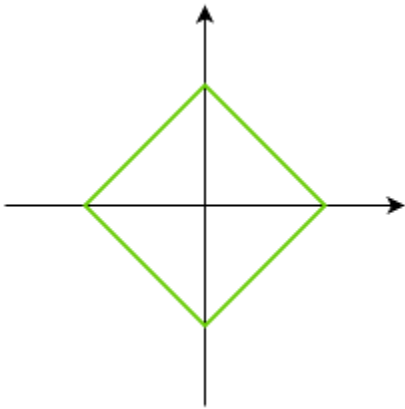

- l_0 distance between $(0, 0)$ and $(0, 5)$?
- l_0 distance between $(1, 1)$ and $(2, 2)$?
- $(\text{username}, \text{password})$

Solution

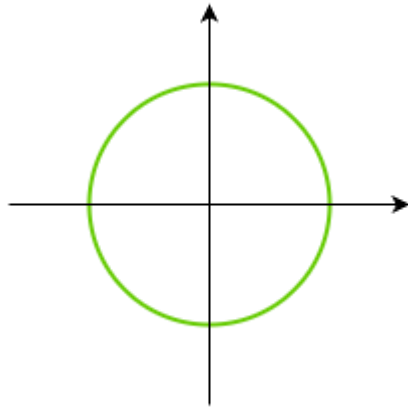

- 1
- 2
- When l_0 is 0, then we can infer that username and password is a match and we can authenticate the user.

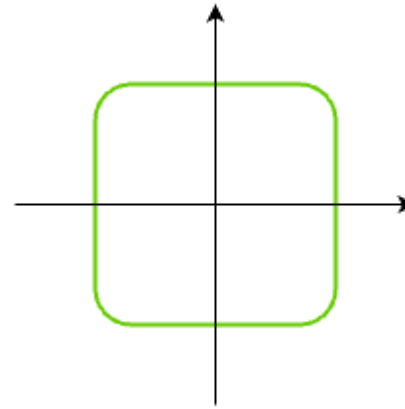

□ For $p \geq 1$, l_p norm is convex

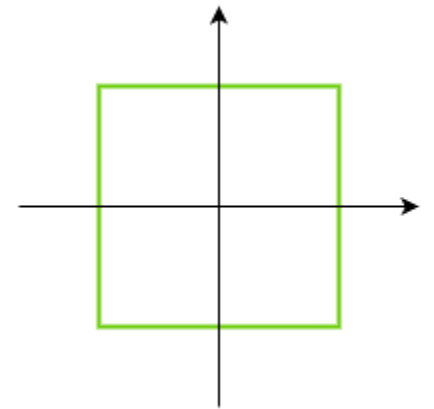

$$\|x\|_1 = 1$$

$$\|x\|_2 = 1$$

$$\|x\|_p = 1$$

$$\|x\|_\infty = 1$$

□ Square of l_2

$$x = \begin{bmatrix} x_1 \\ x_2 \\ \dots \\ x_n \end{bmatrix}$$

$$\|x\|_2^2 = x_1^2 + x_2^2 + \dots + x_n^2$$

$$\Rightarrow \begin{cases} \frac{d\|x\|_2^2}{dx_1} = 2x_1 \\ \frac{d\|x\|_2^2}{dx_2} = 2x_2 \\ \dots \\ \frac{d\|x\|_2^2}{dx_n} = 2x_n \end{cases}$$

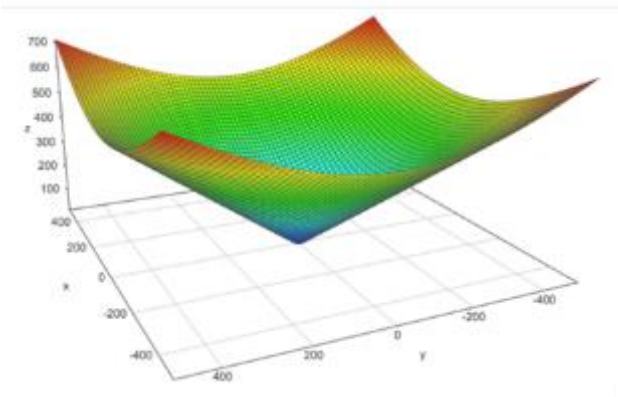

□ l_2

$$x = \begin{bmatrix} x_1 \\ x_2 \\ \dots \\ x_n \end{bmatrix} \quad \|x\|_2 = \sqrt{x_1^2 + x_2^2 + \dots + x_n^2} = (x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}}$$

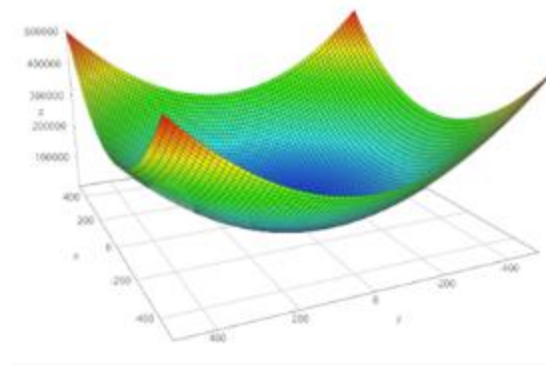

$$\begin{aligned} \frac{d\|x\|_2}{dx_1} &= \frac{1}{2} (x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}-1} \cdot \frac{d}{dx_1} (x_1^2 + x_2^2 + \dots + x_n^2) \\ &= \frac{1}{2} (x_1^2 + x_2^2 + \dots + x_n^2)^{-\frac{1}{2}} \cdot \frac{d}{dx_1} (x_1^2 + x_2^2 + \dots + x_n^2) \\ &= \frac{1}{2} \cdot \frac{1}{(x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}}} \cdot \frac{d}{dx_1} (x_1^2 + x_2^2 + \dots + x_n^2) \\ &= \frac{1}{2} \cdot \frac{1}{(x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}}} \cdot 2 \cdot x_1 \\ &= \frac{x_1}{(x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}}} \end{aligned}$$

$$\Rightarrow \left\{ \begin{aligned} \frac{d\|x\|_2^2}{dx_1} &= \frac{x_1}{(x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}}} \\ \frac{d\|x\|_2^2}{dx_2} &= \frac{x_2}{(x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}}} \\ &\dots \\ \frac{d\|x\|_2^2}{dx_n} &= \frac{x_n}{(x_1^2 + x_2^2 + \dots + x_n^2)^{\frac{1}{2}}} \end{aligned} \right.$$

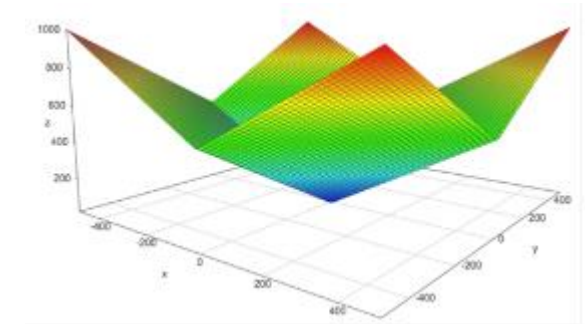

Norm Comparisons

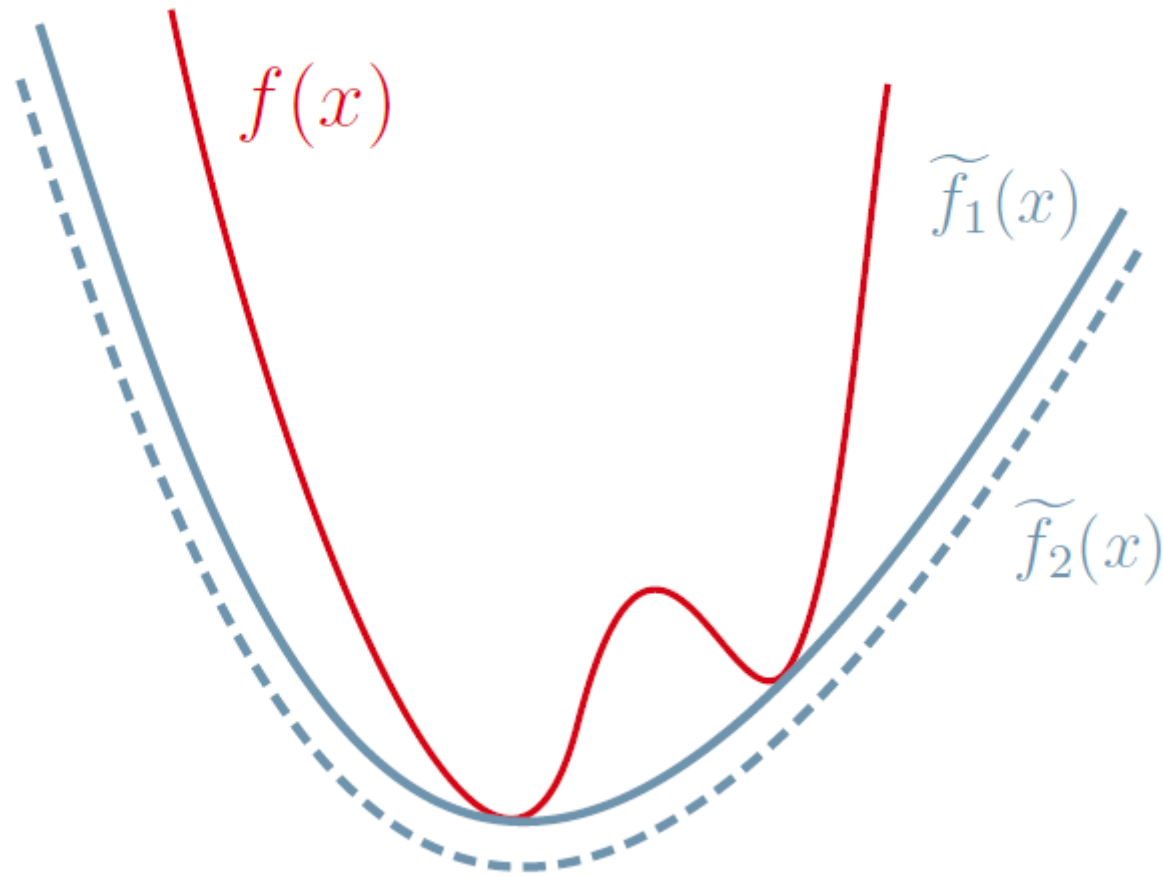

l_2 norm

Square l_2 norm

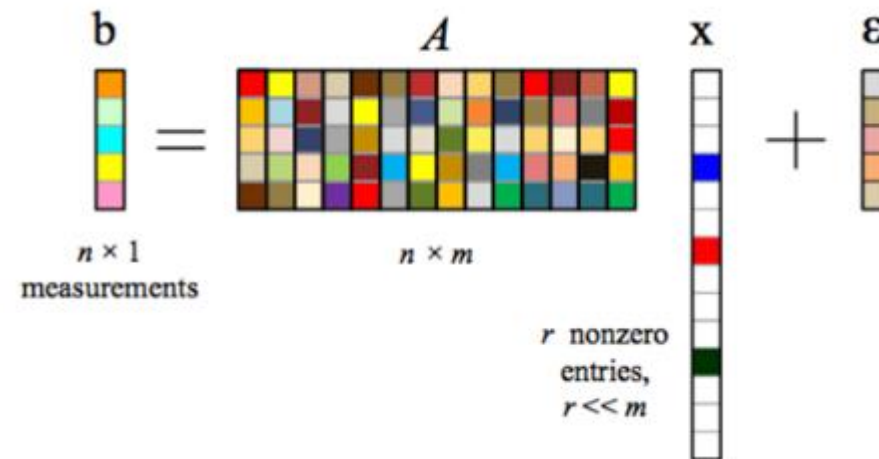

l_1 norm

- **Alternative viewpoint:** We try to find the sparsest solution which explains our noisy measurements

$$\min_x \|x\|_0, \quad \text{subject to } \|Ax - b\|_2 < \epsilon$$

- Here, the l_0 -norm is a shorthand notation for counting the number of non-zero elements in x .

- ❑ l_0 optimization is np-hard.
- ❑ Convex relaxation for solving the problem.

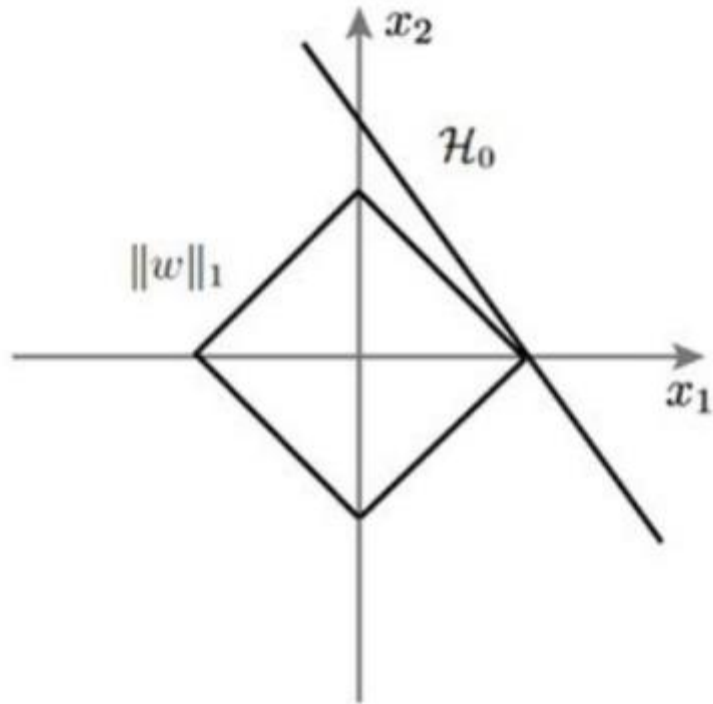

$$\min_1 \|x\|_1$$

$$\text{subject to } \|Ax - b\|_2 < \epsilon$$

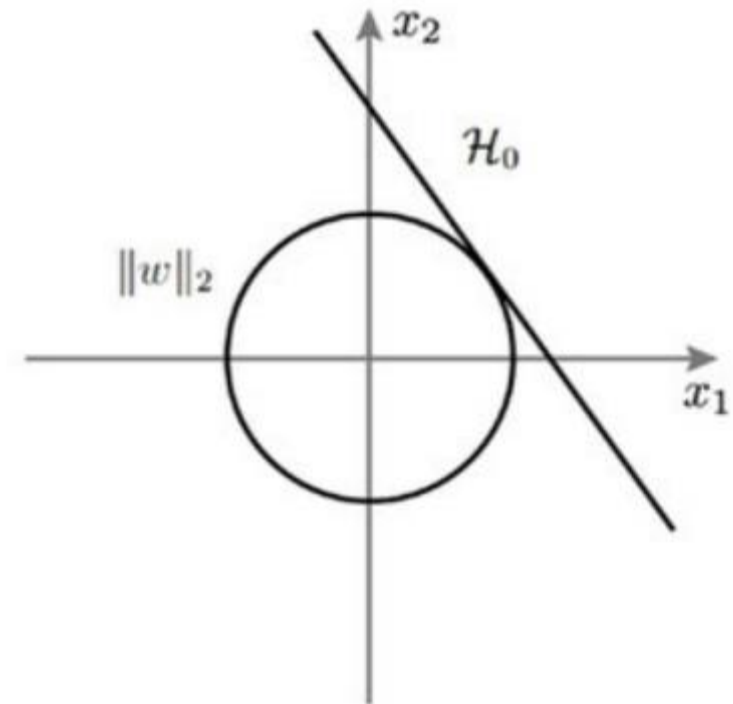

$$\min_1 \|x\|_0$$

$$\text{subject to } \|Ax - b\|_2 < \epsilon$$

Why is l_1 supposed to lead to sparsity than l_2 ?

l_1 regularization

l_2 regularization

Theorem

For all $x \in \mathbb{R}^d$:

$$\|x\|_2 \leq \|x\|_1 \leq \sqrt{d} \|x\|_2$$

Proof

Theorem

For all $x \in \mathbb{R}^d$:

$$\begin{aligned} \|x\|_{\infty} &\leq \|x\|_1 \leq d \|x\|_{\infty} \\ \|x\|_{\infty} &\leq \|x\|_2 \leq \sqrt{d} \|x\|_{\infty} \end{aligned}$$

Proof

□ By a normed linear space (briefly normed space) is meant a real or complex vector space E in which every vector x is associated with a real number $|x|$, called its absolute value or norm, in such a manner **that the properties** $(a') - (c')$ holds. That is, for any vectors $x, y \in E$ and scalar α we have:

i. $|x| \geq 0$

ii. $|x| = 0$ *iff* $x = \vec{0}$

iii. $|\alpha x| = |\alpha||x|$

iv. $|x + y| \leq |x| + |y|$
