

Matrix Properties

CE40282-1: Linear Algebra
Hamid R. Rabiee and Maryam Ramezani
Sharif University of Technology

Basic Notation

- By $A \in \mathbb{R}^{m \times n}$ we denote a matrix with m rows and n columns, where the entries of A are real numbers.

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix} = \begin{bmatrix} | & | & & | \\ a_1 & a_2 & \cdots & a_n \\ | & | & & | \end{bmatrix} = \begin{bmatrix} - & a_1^T & - \\ - & a_2^T & - \\ & \vdots & \\ - & a_m^T & - \end{bmatrix}$$

Matrices Equality

- Two matrices are equal if they have the same size ($m \times n$) and entries corresponding to the same position are equal

For $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$,

$A = B$ if and only if $a_{ij} = b_{ij}$ for $1 \leq i \leq m$, $1 \leq j \leq n$

Matrix Operations

- Matrix-Matrix addition
- Scalar-Matrix multiplication
- Matrix-Vector multiplication
- Matrix-Matrix multiplication

Matrix-Matrix Addition

- (just like vectors) we can add or subtract **matrices of the same size**:

$$(A + B)_{ij} = A_{ij} + B_{ij}, \quad i = 1, \dots, m, \quad j = 1, \dots, n$$

- Properties:
 - Commutative $A + B = B + A$
 - Associative $A + (B + C) = (A + B) + C$
 - Addition with zero $A + 0 = A$
 - Transpose $(A + B)^T = A^T + B^T$

Scalar-Matrix Multiplication

- Example $2 \begin{bmatrix} 1 & -1 & 2 \\ -3 & 0 & 4 \end{bmatrix} = \begin{bmatrix} 2 & -2 & 4 \\ -6 & 0 & 8 \end{bmatrix}$
- Properties:
 - Associative $(\alpha\beta)A = \alpha(\beta A)$
 - Distributive property of scalar multiplication over real-number addition $(\alpha + \beta)A = \alpha A + \beta A$
 - Distributive property of scalar multiplication over matrix addition $\alpha(A + B) = \alpha A + \alpha B$
 - $0A = 0$ $1A = A$
 - Transpose $(\alpha A)^T = \alpha A^T$

Review: Vector-Vector Product

- *inner product* or *dot product*

$$x^T y \in \mathbb{R} = \begin{bmatrix} x_1 & x_2 & \cdots & x_n \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{bmatrix} = \sum_{i=1}^n x_i y_i.$$

- *outer product*

$$xy^T \in \mathbb{R}^{m \times n} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_m \end{bmatrix} \begin{bmatrix} y_1 & y_2 & \cdots & y_n \end{bmatrix} = \begin{bmatrix} x_1 y_1 & x_1 y_2 & \cdots & x_1 y_n \\ x_2 y_1 & x_2 y_2 & \cdots & x_2 y_n \\ \vdots & \vdots & \ddots & \vdots \\ x_m y_1 & x_m y_2 & \cdots & x_m y_n \end{bmatrix}.$$

Matrix-Vector Multiplication

- If we write A by rows, then we can express Ax as,

$$A \in \mathbb{R}^{m \times n} \quad y = Ax = \begin{bmatrix} - & a_1^T & - \\ - & a_2^T & - \\ & \vdots & \\ - & a_m^T & - \end{bmatrix} x = \begin{bmatrix} a_1^T x \\ a_2^T x \\ \vdots \\ a_m^T x \end{bmatrix} . \quad a_i^T x = \sum_{j=1}^n a_{ij} x_j$$

- If we write A by columns, then we have:

$$y = Ax = \begin{bmatrix} | & | & & | \\ a_1 & a_2 & \cdots & a_n \\ | & | & & | \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \begin{bmatrix} a_1 \end{bmatrix} x_1 + \begin{bmatrix} a_2 \end{bmatrix} x_2 + \dots + \begin{bmatrix} a_n \end{bmatrix} x_n .$$

y is a *linear combination* of the *columns* of A .

- columns of A are linearly independent if $Ax = 0$ implies $x = 0$

Matrix-Vector Multiplication

It is also possible to multiply on the left by a row vector.

$$A \in \mathbb{R}^{m \times n}$$

- If we write A by columns, then we can express $x^T A$ as,

$$y^T = x^T A = x^T \begin{bmatrix} | & | & \cdots & | \\ a_1 & a_2 & \cdots & a_n \\ | & | & \cdots & | \end{bmatrix} = [x^T a_1 \quad x^T a_2 \quad \cdots \quad x^T a_n]$$

- expressing A in terms of rows we have:

$$\begin{aligned} y^T = x^T A &= [x_1 \quad x_2 \quad \cdots \quad x_m] \begin{bmatrix} - & a_1^T & - \\ - & a_2^T & - \\ & \vdots & \\ - & a_m^T & - \end{bmatrix} \\ &= x_1 [- \quad a_1^T \quad -] + x_2 [- \quad a_2^T \quad -] + \dots + x_m [- \quad a_m^T \quad -] \end{aligned}$$

y^T is a linear combination of the *rows* of A .

□ Example for different representations of matrix-vector multiplication

Matrix-Vector Multiplication

■ Properties

- $A(u + v) = Au + Av$
- $(A + B)u = Au + Bu$
- $(\alpha A)u = \alpha(Au) = A(\alpha u) = \alpha Au$
- $0u = 0$
- $A0 = 0$
- $Iu = u$

Matrix-Vector Multiplication

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix} = \begin{bmatrix} | & | & \cdots & | \\ a_1 & a_2 & \cdots & a_n \\ | & | & \cdots & | \end{bmatrix} = \begin{bmatrix} - & a_1^T & - \\ - & a_2^T & - \\ & \vdots & \\ - & a_m^T & - \end{bmatrix}$$

- Column j : $a_j =$
- Row i : $a_i^T =$
- Vector sum of rows of $A =$
- Vector sum of columns of $A =$

$$\begin{bmatrix} -1 & 2 & 1 \\ 2 & 0 & -2 \end{bmatrix}$$

Linear Transformation

$$L(\vec{v} + \vec{w}) = L(\vec{v}) + L(\vec{w})$$

“Additivity”

$$L(c\vec{v}) = cL(\vec{v})$$

“Scaling”

- Linear Transformation
 - Lines remain lines
 - Origin remains fixed

Linear Transformation

https://www.youtube.com/watch?v=kYB8IZa5AuE&list=PLZHQObOWTQDPD3MizzM2xVFitgF8hE_ab&index=3

Matrix-Matrix Multiplication

- Matrix-matrix: $A \in \mathbb{R}^{m \times k}$, $B \in \mathbb{R}^{k \times n} \rightarrow \mathbb{R}^{m \times n}$
 – a_i rows of A , b_j cols of B

$$C = AB \quad \text{for } 1 \leq i \leq m, 1 \leq j \leq n \text{ inner product}$$

$$C_{ij} = a_i^T b_j$$

Matrix-Matrix Multiplication (different views)

1. As a set of vector-vector products

$$C = AB = \begin{bmatrix} \text{---} & a_1^T & \text{---} \\ \text{---} & a_2^T & \text{---} \\ & \vdots & \\ \text{---} & a_m^T & \text{---} \end{bmatrix} \begin{bmatrix} \begin{array}{c} | \\ b_1 \\ | \end{array} & \begin{array}{c} | \\ b_2 \\ | \end{array} & \cdots & \begin{array}{c} | \\ b_p \\ | \end{array} \end{bmatrix} = \begin{bmatrix} a_1^T b_1 & a_1^T b_2 & \cdots & a_1^T b_p \\ a_2^T b_1 & a_2^T b_2 & \cdots & a_2^T b_p \\ \vdots & \vdots & \ddots & \vdots \\ a_m^T b_1 & a_m^T b_2 & \cdots & a_m^T b_p \end{bmatrix}$$

2. As a sum of outer products

$$C = AB = \begin{bmatrix} \begin{array}{c} | \\ a_1 \\ | \end{array} & \begin{array}{c} | \\ a_2 \\ | \end{array} & \cdots & \begin{array}{c} | \\ a_n \\ | \end{array} \end{bmatrix} \begin{bmatrix} \text{---} & b_1^T & \text{---} \\ \text{---} & b_2^T & \text{---} \\ & \vdots & \\ \text{---} & b_n^T & \text{---} \end{bmatrix} = \sum_{i=1}^n a_i b_i^T$$

Matrix-Matrix Multiplication (different views)

3. As a set of matrix-vector products.

$$C = AB = A \begin{bmatrix} | & | & \cdots & | \\ b_1 & b_2 & \cdots & b_p \\ | & | & \cdots & | \end{bmatrix} = \begin{bmatrix} | & | & \cdots & | \\ Ab_1 & Ab_2 & \cdots & Ab_p \\ | & | & \cdots & | \end{bmatrix}.$$

Here the i th column of C is given by the matrix-vector product with the vector on the right, $c_i = Ab_i$. These matrix-vector products can in turn be interpreted using both viewpoints given in the previous subsection.

4. As a set of vector-matrix products.

$$C = AB = \begin{bmatrix} - & a_1^T & - \\ - & a_2^T & - \\ & \vdots & \\ - & a_m^T & - \end{bmatrix} B = \begin{bmatrix} - & a_1^T B & - \\ - & a_2^T B & - \\ & \vdots & \\ - & a_m^T B & - \end{bmatrix}$$

Matrix-Matrix Multiplication

■ Properties:

- Associative

$$(AB)C = A(BC)$$

- Distributive

$$A(B + C) = AB + AC$$

- NOT commutative

$$AB \neq BA$$

– Dimensions may not even be conformable

Matrix Power

- A^k : repeated multiplication of a square matrix

$$A^1 = A, A^2 = AA, \dots, A^k = \underbrace{AA \cdots A}_{k \text{ matrices}}$$

- Properties:

- $A^j A^k = A^{j+k}$

where j and k are nonnegative integers
and A^0 is assumed to be I

- $(A^j)^k = A^{jk}$

- For diagonal matrices:

$$D = \begin{bmatrix} d_1 & 0 & \cdots & 0 \\ 0 & d_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & d_n \end{bmatrix} \Rightarrow D^k = \begin{bmatrix} d_1^k & 0 & \cdots & 0 \\ 0 & d_2^k & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & d_n^k \end{bmatrix}$$

Note

- Two properties which is held for real numbers, but not for matrices:
 - (1) commutative property of matrix multiplication

$$ab = ba \quad AB \neq BA$$

- Example

$$A = \begin{bmatrix} 1 & 3 \\ 2 & -1 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 2 & -1 \\ 0 & 2 \end{bmatrix}$$

$$AB = \begin{bmatrix} 1 & 3 \\ 2 & -1 \end{bmatrix} \begin{bmatrix} 2 & -1 \\ 0 & 2 \end{bmatrix} = \begin{bmatrix} 2 & 5 \\ 4 & -4 \end{bmatrix}$$

$$BA = \begin{bmatrix} 2 & -1 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} 1 & 3 \\ 2 & -1 \end{bmatrix} = \begin{bmatrix} 0 & 7 \\ 4 & -2 \end{bmatrix}$$

Note

■ (2) cancellation law

$$ac = bc, \quad c \neq 0 \quad \Rightarrow \quad a = b$$

$AC = BC$ and $C \neq 0$ (C is not a zero matrix)

(1) If C is invertible, then $A = B$

(2) If C is not invertible, then $A \neq B$

■ Example

$$A = \begin{bmatrix} 1 & 3 \\ 0 & 1 \end{bmatrix}, \quad B = \begin{bmatrix} 2 & 4 \\ 2 & 3 \end{bmatrix}, \quad C = \begin{bmatrix} 1 & -2 \\ -1 & 2 \end{bmatrix}$$

$$AC = \begin{bmatrix} 1 & 3 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & -2 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} -2 & 4 \\ -1 & 2 \end{bmatrix}$$

$$BC = \begin{bmatrix} 2 & 4 \\ 2 & 3 \end{bmatrix} \begin{bmatrix} 1 & -2 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} -2 & 4 \\ -1 & 2 \end{bmatrix}$$

So, although $AC = BC$, $A \neq B$

Matrix Exponential Application

- Solve systems of linear ordinary differential equations.

$$\frac{d}{dt}y(t) = Ay(t), \quad y(0) = y_0$$

where A is a constant matrix, is given by

$$y(t) = e^{At}y_0.$$

Matrix Exponential

- Is a matrix function on square matrices (A) using Taylor series:

$$e^A = 1 + A + \frac{1}{2!}A^2 + \frac{1}{3!}A^3 + \frac{1}{4!}A^4 + \dots$$

- Special Case: When A is Diagonal:

$$A = \begin{bmatrix} \alpha & 0 \\ 0 & \beta \end{bmatrix} \Rightarrow e^A = \begin{bmatrix} e^\alpha & 0 \\ 0 & e^\beta \end{bmatrix}$$

Matrix Operations Complexity

- ▶ $m \times n$ matrix stored A as $m \times n$ array of numbers
(for sparse A , store only $\mathbf{nnz}(A)$ nonzero values)
- ▶ matrix addition, scalar-matrix multiplication cost mn flops
- ▶ matrix-vector multiplication costs $m(2n - 1) \approx 2mn$ flops
(for sparse A , around $2\mathbf{nnz}(A)$ flops)

Transpose

- The *transpose* of a matrix results from “flipping” the rows and columns. Given a matrix $A \in \mathbb{R}^{m \times n}$, its transpose, written $A^T \in \mathbb{R}^{n \times m}$, is the $n \times m$ matrix whose entries are given by

$$(A^T)_{ij} = A_{ji}.$$

- Properties:

- $(A^T)^T = A$
- $(A + B)^T = A^T + B^T$
- $(cA)^T = c(A^T)$
- $(AB)^T = B^T A^T \longrightarrow (A_1 A_2 A_3 \cdots A_n)^T = A_n^T \cdots A_3^T A_2^T A_1^T$

Conjugate Transpose

$$\mathbf{A}^* = \mathbf{A}^H = \left(\overline{\mathbf{A}}\right)^T = \overline{\mathbf{A}^T}$$

$$\mathbf{A} = \begin{bmatrix} 1 & -2-i & 5 \\ 1+i & i & 4-2i \end{bmatrix} \quad \mathbf{A}^H = \begin{bmatrix} 1 & 1-i \\ -2+i & -i \\ 5 & 4+2i \end{bmatrix}$$

- $(\mathbf{A} + \mathbf{B})^H = \mathbf{A}^H + \mathbf{B}^H$ for any two matrices \mathbf{A} and \mathbf{B} of the same dimensions.
- $(z\mathbf{A})^H = \bar{z}\mathbf{A}^H$ for any complex number z and any m -by- n matrix \mathbf{A} .
- $(\mathbf{AB})^H = \mathbf{B}^H \mathbf{A}^H$ for any m -by- n matrix \mathbf{A} and any n -by- p matrix \mathbf{B} . Note that the order of the factors is reversed.
- $(\mathbf{A}^H)^H = \mathbf{A}$ for any m -by- n matrix \mathbf{A} .

✓ \quad \quad \quad \underline{\hspace{2cm}}

For **real** matrices, the conjugate transpose is just the transpose, $\mathbf{A}^H = \mathbf{A}^T$.

Trace

The **trace** of a square matrix $A \in \mathbb{R}^{n \times n}$, denoted $\text{tr}A$, is the sum of diagonal elements in the matrix:

$$\text{tr}A = \sum_{i=1}^n A_{ii}. \quad \text{Tr} \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1,n-1} & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2,n-1} & a_{2n} \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ a_{n-1,1} & a_{n-1,2} & \cdots & a_{n-1,n-1} & a_{n-1,n} \\ a_{n1} & a_{n2} & \cdots & a_{n,n-1} & a_{nn} \end{pmatrix} = a_{11} + a_{22} + \cdots + a_{nn}.$$

The trace has the following properties:

- For $A \in \mathbb{R}^{n \times n}$, $\text{tr}A = \text{tr}A^T$.
- For $A, B \in \mathbb{R}^{n \times n}$, $\text{tr}(A + B) = \text{tr}A + \text{tr}B$.
- For $A \in \mathbb{R}^{n \times n}$, $t \in \mathbb{R}$, $\text{tr}(tA) = t \text{tr}A$.
- For A, B such that AB is square, $\text{tr}AB = \text{tr}BA$.
- For A, B, C such that ABC is square, $\text{tr}ABC = \text{tr}BCA = \text{tr}CAB$, and so on for the product of more matrices.

■ Trace is a linear function on the matrix space. Why?

■ Example:

Show that there do not exist matrices $A, B \in \mathcal{M}_n$ such that $AB - BA = I$.

Kronecker sum

- A and B are **square matrices**, the Kronecker sum is:

$$A \oplus B = A \otimes I_b + I_a \otimes B$$

- Properties:

Matrix exponential

$$\exp(A) \otimes \exp(B) = \exp(A \oplus B)$$

- Example

$$\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \oplus \begin{bmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{bmatrix} = \begin{bmatrix} a_{11} + b_{11} & b_{12} & a_{12} & 0 \\ b_{21} & a_{11} + b_{22} & 0 & a_{12} \\ a_{21} & 0 & a_{22} + b_{11} & b_{12} \\ 0 & a_{21} & b_{21} & a_{22} + b_{22} \end{bmatrix}$$

Elementary Matrices

- An **elementary matrix** is one that is obtained by performing a single elementary row operation on an identity matrix.

If an elementary row operation is performed on an $m \times n$ matrix A , the resulting matrix can be written as EA , where the $m \times m$ matrix E is created by performing the same row operation on I_m .

- Example

$$E_1 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ -4 & 0 & 1 \end{bmatrix}, \quad E_2 = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \quad E_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 5 \end{bmatrix},$$
$$A = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$$

Useful Matrices

- An $m \times n$ matrix is
 - Tall $m > n$
 - Wide $n > m$
 - Square $m = n$
- Main diagonal of matrix

$$A_{n \times n} = \left[\begin{array}{c} \diagdown \end{array} \right] \quad a_{11}, a_{22}, \dots, a_{nn}$$

- Anti diagonal of matrix

$$A_{n \times n} = \left[\begin{array}{c} \diagup \end{array} \right] \quad a_{1,n}, a_{2,n-1}, \dots, a_{n,1}$$

Useful Matrices

- **Identity matrix** $I \in \mathbb{R}^{n \times n}$, is a square matrix with ones on the diagonal and zeros everywhere else. That is,

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$I_{ij} = \begin{cases} 1 & i = j \\ 0 & i \neq j \end{cases}$$

$I_n = [e_1, e_2, e_3]$ It has the property that for all $A \in \mathbb{R}^{m \times n}$,

$$AI = A = IA.$$

- **Diagonal matrix**

a matrix where all non-diagonal elements are 0. $D = \text{diag}(d_1, d_2, \dots, d_n)$, with

$$D_{ij} = \begin{cases} d_i & i = j \\ 0 & i \neq j \end{cases} \quad A = \text{diag}(a_1, \dots, a_m) = \begin{bmatrix} a_1 & \cdots & 0 \\ \vdots & a_i & \vdots \\ 0 & \cdots & a_m \end{bmatrix}$$

Clearly, $I = \text{diag}(1, 1, \dots, 1)$.

- **Scalar matrix** A special kind of diagonal matrix in which all diagonal elements are the same

$$\begin{bmatrix} 3 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 3 \end{bmatrix}$$

Useful Matrices

- A matrix A over R is called:
 - **symmetric** if $A^T = A$
 - **skew-symmetric** if $A^T = -A$
 - $A^T A$ must be symmetric (A with any size, it is not necessary for A to be a square matrix)

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 4 & -1 \\ 3 & -1 & 4 \end{bmatrix} \text{ and } B = \begin{bmatrix} 0 & 1 & 2 \\ -1 & 0 & -3 \\ -2 & 3 & 0 \end{bmatrix}$$

- A is **orthogonal** if $AA^T = A^T A = I$

$$A = \begin{bmatrix} \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} & \frac{1}{\sqrt{3}} \\ \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} & 0 \\ \frac{1}{\sqrt{6}} & \frac{1}{\sqrt{6}} & -\frac{2}{\sqrt{6}} \end{bmatrix}$$

Useful Matrices

- Let $A = [a_{ij}]$ be an $n \times n$ matrix with $a_{ij} = \begin{cases} 1 & \text{if } i = j + 1 \\ 0 & \text{other} \end{cases}$.

Then $A^n = 0$ and $A^k \neq 0$ for $1 \leq k \leq n - 1$

- Nilpotent**: A for which a positive integer p exists such that $A^p = 0$.
- Order of nilpotency (degree , index)**: Least positive integer p for which $A^p = 0$ is called the.

$$A = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \quad C = \begin{bmatrix} 5 & -3 & 2 \\ 15 & -9 & 6 \\ 10 & -6 & 4 \end{bmatrix}$$

$$B = \begin{bmatrix} 0 & 2 & 1 & 6 \\ 0 & 0 & 1 & 2 \\ 0 & 0 & 0 & 3 \\ 0 & 0 & 0 & 0 \end{bmatrix} \quad B^2 = \begin{bmatrix} 0 & 0 & 2 & 7 \\ 0 & 0 & 0 & 3 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix};$$

$$B^3 = \begin{bmatrix} 0 & 0 & 0 & 6 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}; \quad B^4 = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Hermitian Matrix

- Hermitian matrix (or self-adjoint matrix) is a complex square matrix that is equal to its own conjugate transpose

$$A \text{ Hermitian} \iff A = A^H$$

- conjugate transpose

$$A^H = A^* = (\bar{A})^T$$

Unitary matrix

$$\blacksquare \quad U^*U = UU^* = UU^{-1} = I,$$

If U is a square, complex matrix, then the following conditions are equivalent:^[2]

1. U is unitary.
2. U^* is unitary.
3. U is invertible with $U^{-1} = U^*$.
4. The columns of U form an orthonormal basis of \mathbb{C}^n with respect to the usual inner product. In other words, $U^*U = I$.
5. The rows of U form an orthonormal basis of \mathbb{C}^n with respect to the usual inner product. In other words, $UU^* = I$.

Useful Matrices

- **Idempotent**: satisfy the condition that $A^2 = A$

Examples of 2×2 idempotent matrices are:

$$\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \begin{bmatrix} 3 & -6 \\ 1 & -2 \end{bmatrix}$$

Examples of 3×3 idempotent matrices are:

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad \begin{bmatrix} 2 & -2 & -4 \\ -1 & 3 & 4 \\ 1 & -2 & -3 \end{bmatrix}$$

If a matrix $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$ is idempotent, then

- $a = a^2 + bc$,
- $b = ab + bd$, implying $b(1 - a - d) = 0$ so $b = 0$ or $d = 1 - a$,
- $c = ca + cd$, implying $c(1 - a - d) = 0$ so $c = 0$ or $d = 1 - a$,
- $d = bc + d^2$.

Useful Matrices

- **Toeplitz: diagonal-constant matrix:** values on diagonals are equal
- A Toeplitz matrix is not necessarily square.

$$A = \begin{bmatrix} a_0 & a_{-1} & a_{-2} & \cdots & \cdots & a_{-(n-1)} \\ a_1 & a_0 & a_{-1} & \ddots & & \vdots \\ a_2 & a_1 & \ddots & \ddots & \ddots & \vdots \\ \vdots & \ddots & \ddots & \ddots & a_{-1} & a_{-2} \\ \vdots & & \ddots & a_1 & a_0 & a_{-1} \\ a_{n-1} & \cdots & \cdots & a_2 & a_1 & a_0 \end{bmatrix}$$

$$A_{i,j} = A_{i+1,j+1} = a_{i-j}.$$

$$T(b) = \begin{bmatrix} b_1 & 0 & 0 & 0 \\ b_2 & b_1 & 0 & 0 \\ b_3 & b_2 & b_1 & 0 \\ 0 & b_3 & b_2 & b_1 \\ 0 & 0 & b_3 & b_2 \\ 0 & 0 & 0 & b_3 \end{bmatrix}$$

Useful Matrices

- **Submatrix of matrix:** A matrix obtained by deleting some of the rows and/or columns of a matrix is said to be a submatrix of the given matrix.

$$A = \begin{bmatrix} 1 & 4 & 5 \\ 0 & 1 & 2 \end{bmatrix}$$

$$[1], [2], \begin{bmatrix} 1 \\ 0 \end{bmatrix}, [1 \ 5], \begin{bmatrix} 1 & 5 \\ 0 & 2 \end{bmatrix}, A, \begin{bmatrix} 1 & 4 \\ 1 & 0 \end{bmatrix}, \begin{bmatrix} 1 & 4 \\ 0 & 2 \end{bmatrix}$$

Useful Matrices

■ Zero or null Matrix

If $A \in M_{m \times n}$, and c is a scalar,

then (1) $A + 0_{m \times n} = A$

※ So, $0_{m \times n}$ is also called the additive identity for the set of all $m \times n$ matrices

(2) $A + (-A) = 0_{m \times n}$

※ Thus, $-A$ is called the additive inverse of A

(3) $cA = 0_{m \times n} \Rightarrow c = 0$ or $A = 0_{m \times n}$

All above properties are very similar to the counterpart properties for the real number 0

Useful Matrices

- **Block Matrix** whose entries are matrices, such as

$$A = \begin{bmatrix} \textcircled{B} & C \\ D & E \end{bmatrix} \quad \begin{array}{l} \text{Submatrix or} \\ \text{block of } A \end{array}$$

$$B = \begin{bmatrix} 0 & 2 & 3 \end{bmatrix}, \quad C = \begin{bmatrix} -1 \end{bmatrix}, \quad D = \begin{bmatrix} 2 & 2 & 1 \\ 1 & 3 & 5 \end{bmatrix}, \quad E = \begin{bmatrix} 4 \\ 4 \end{bmatrix}$$

then

$$\begin{bmatrix} B & C \\ D & E \end{bmatrix} = \begin{bmatrix} 0 & 2 & 3 & -1 \\ 2 & 2 & 1 & 4 \\ 1 & 3 & 5 & 4 \end{bmatrix}$$

- Matrices in each block row must have same height (row dimension)
- Matrices in each block column must have same width (column dimension)
- **Note: A is not a square matrix but it is a block square matrix.**

Useful Matrices

■ Block Matrix

- Transpose of block matrix $\begin{bmatrix} A & B \\ C & D \end{bmatrix}^T = \begin{bmatrix} A^T & C^T \\ B^T & D^T \end{bmatrix}$
- Multiplication

$$A = \left[\begin{array}{ccc|cc} 2 & -3 & 1 & 0 & -4 \\ 1 & 5 & -2 & 3 & -1 \\ \hline 0 & -4 & -2 & 7 & -1 \end{array} \right] = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}, \quad B = \left[\begin{array}{c|c} 6 & 4 \\ -2 & 1 \\ -3 & 7 \\ \hline -1 & 3 \\ 5 & 2 \end{array} \right] = \begin{bmatrix} B_1 \\ B_2 \end{bmatrix}$$

$$AB = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \begin{bmatrix} B_1 \\ B_2 \end{bmatrix} = \begin{bmatrix} A_{11}B_1 + A_{12}B_2 \\ A_{21}B_1 + A_{22}B_2 \end{bmatrix} = \begin{bmatrix} -5 & 4 \\ -6 & 2 \\ \hline 2 & 1 \end{bmatrix}$$

Useful Matrices

■ Triangular matrix

- Upper triangular $a_{ij} = 0, \quad i > j$
- Lower triangular $a_{ij} = 0, \quad i < j$

Upper Triangular
Matrix

Lower Triangular
Matrix

Useful Matrices

- Sparse matrix

- Density of matrix $A_{m \times n}$
- Density of identity matrix?
- Sparse matrix has low density

$$1 \geq \frac{\text{nnz}(A)}{mn}$$

Permutation Matrix

- A square $n \times n$ matrix (P) obtained by rearranging the rows of I_n
- Permutation matrix is orthogonal ($PP^T = I$)

- How many possible permutation matrix? $P = \begin{bmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix}$
- A product of permutation matrices is again a permutation matrix
- Some power of a permutation matrix is identity. Why? (*e.g.*: $p^3 = I$)
- The inverse of a permutation matrix is again a permutation matrix

Permutation Matrix Application

$$B = \begin{pmatrix} 1 & 2 & 0 \\ 0 & 3 & 4 \\ 5 & 6 & 7 \end{pmatrix} \quad P = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix}$$

- Interchange the columns of matrix B: $P_{ij} = 1$ column i is moved to column j

$$BP = \begin{pmatrix} 1 & 2 & 0 \\ 0 & 3 & 4 \\ 5 & 6 & 7 \end{pmatrix} \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} = \begin{pmatrix} 0 & 2 & 1 \\ 4 & 3 & 0 \\ 7 & 6 & 5 \end{pmatrix}$$

- Interchange the rows of matrix B: $P_{ij} = 1$ row j is moved to row i

$$PB = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} 1 & 2 & 0 \\ 0 & 3 & 4 \\ 5 & 6 & 7 \end{pmatrix} = \begin{pmatrix} 5 & 6 & 7 \\ 0 & 3 & 4 \\ 1 & 2 & 0 \end{pmatrix}$$

Vec Operator

- The vec-operator applied on a matrix \mathbf{A} stacks the columns into a vector

$$\mathbf{A} = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \quad \text{vec}(\mathbf{A}) = \begin{bmatrix} A_{11} \\ A_{21} \\ A_{12} \\ A_{22} \end{bmatrix}$$

- Properties:

$$\begin{aligned} \text{vec}(\mathbf{AXB}) &= (\mathbf{B}^T \otimes \mathbf{A})\text{vec}(\mathbf{X}) \\ \text{Tr}(\mathbf{A}^T \mathbf{B}) &= \text{vec}(\mathbf{A})^T \text{vec}(\mathbf{B}) \\ \text{vec}(\mathbf{A} + \mathbf{B}) &= \text{vec}(\mathbf{A}) + \text{vec}(\mathbf{B}) \\ \text{vec}(\alpha \mathbf{A}) &= \alpha \cdot \text{vec}(\mathbf{A}) \\ \mathbf{a}^T \mathbf{X} \mathbf{B} \mathbf{X}^T \mathbf{c} &= \text{vec}(\mathbf{X})^T (\mathbf{B} \otimes \mathbf{c} \mathbf{a}^T) \text{vec}(\mathbf{X}) \end{aligned}$$

Conclusion

Real Case	Complex Case
$u \cdot v = u^T v = v^T u$	$u \cdot v = v^* u$
Transpose $()^T$	Conjugate transpose $()^*$
Orthogonal matrix $AA^T = I$	Unitary matrix $UU^* = I$
Symmetric matrix $A = A^T$	Hermitian matrix $H = H^*$
